CASE STUDY LEARNING

- Case studies are a written description of a real life problem or situation.
- Only the facts are provided, usually in chronologic sequence similar to what would be encounter in a patient care setting.
- The use of cases actively involves the student in the analysis of facts and details of the case, selection of a solution to the problem, and defence of his or her solution through discussion of the case.
- In case based learning, students use their recall of previously learned information to solve clinical case.
- The case method is used primarily to develop the skill of self-learning critical thinking, problem identification and decision making.
- Working on subsequent cases with similar problems reinforces information recall. Case studies in the health sciences provide the personal history of an individual patient and information about one or more health problems that must solved.
- The students work through the facts of the case, analyse the available data, gather more information, develop hypothesis, consider possible solutions, arrive at the optimal solution and consider the consequences of the learner's decisions.
- The use of case studies and other active learning strategies will enhance the development of essential skills necessary to practice in any setting including community, ambulatory care, primary care, health systems, long term care, home health care, managed care, and the pharmaceutical industry.

Approved by AICTE & PCI, New Delhi – Affiliated to JNTUA, Anantapur
NH – 18, Nandyal, Kurnool District, Andhra Pradesh - 518501

Project based Learning is another type of learning system to improve problem-solving skills in students. This motivate the students to explore their skills towards research and makes them industry ready. Students are also encouraged to impart the quality of research by promoting their works publishing in UGC Care list and Scopus journals. This enhances the quality of research standards.
